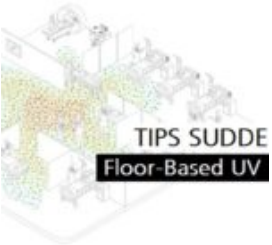
TIPS Sudden Science Trial #1019802: Floor-Based UV Disinfection

By: Michael Diamond

Date : December 6, 2018



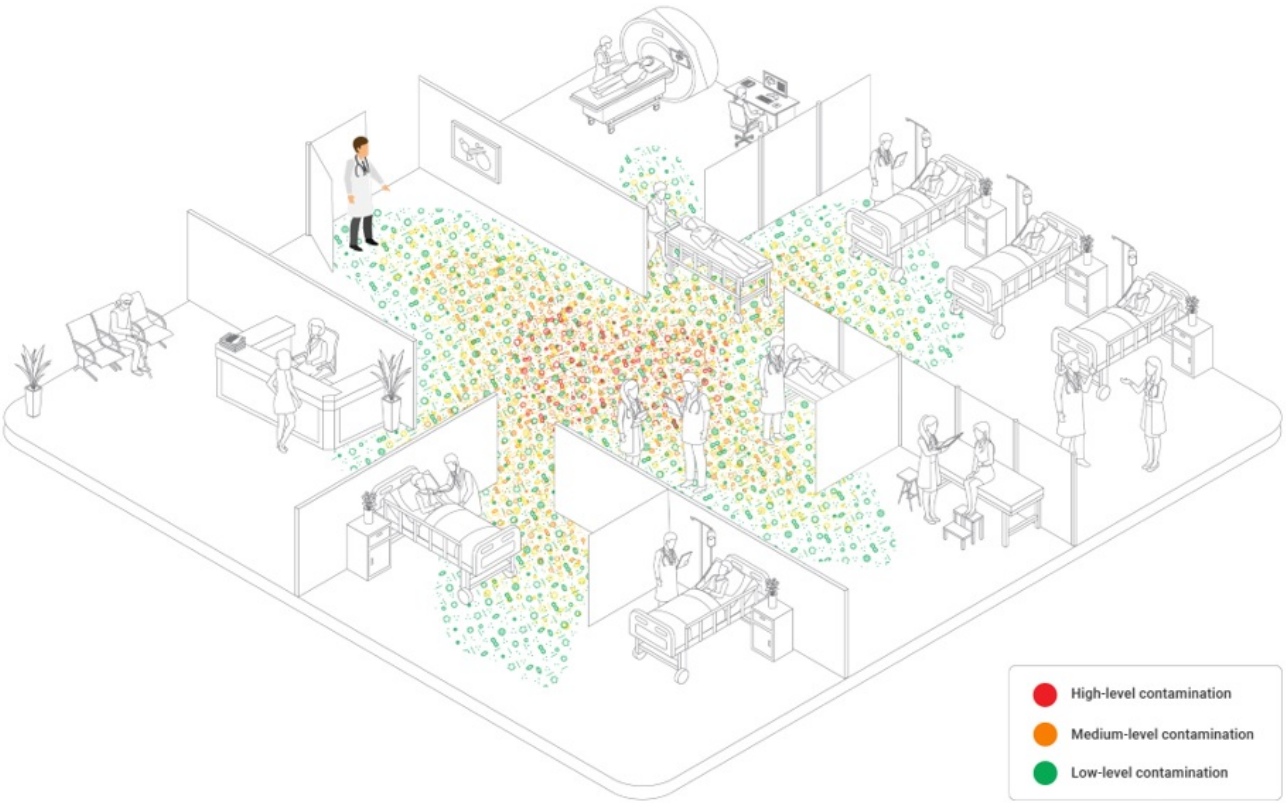
We are seeking up to twenty (20) facilities within the USA and Canada
to use the FloorX device for a 90-day trial period.

THIS OPPORTUNITY HAS SUCCESSFULLY CLOSED.
We look forward to publishing the results in the near future.
TOTAL RESPONSE EXCEEDED EXPECTATIONS.
Thank you to all that applied.
Thank you for supporting the TIPS Sudden Science Program

The Infection Prevention Strategy (TIPS) is proud to launch its second in a series of studies to evaluate the latest innovations in infection prevention and control. TIPS is dedicated to not only presenting the latest information, but also putting new technologies to the test to evaluate their real-world potential.

TIPS has created a model of information-sharing that makes the process of vetting new technologies, implementing successful programs and inspiring innovation more efficient, more accessible, more global and more collaborative. Known as TIPS Sudden Science, the program is driven by our firm belief that we should not have to wait years for promising innovations, ideas and processes to be implemented and accepted. Around the world, our teams develop trials and conduct pilot studies to aid in the discovery of successful research to market technological advancements.

This real-world trial is one step in the vetting and feedback process to ensure that the innovators are considering the end users in their product design.



Sudden Science Initiative #1019802: Floor-Based UV Disinfection

Innovation	FLOORX offers a super-thin sanitizing station for foot traffic. This technology utilizes UV-C LED technology to prevent the spread of HAIs.
